Bright contrast between the leaf pattern shades of green and rich red adds a remarkable dratsenata exotic species. There are several varieties, of which you can stop for the decoration of the house. They are spectacular and make them less care. You can buy dratsenova stick and grow it themselves: the so-called rods are pieces of stem from 5 to 7 cm, which just stick in the soil and begin to bathe regularly. About 6-8 months to release their first beautiful leaves.

Also called dracaena. Extremely durable plant. Motse his trunk to reach to 2-3 feet. Its leaves are edging in different colors: green, yellow, white and red. Its different varieties have different shapes and ukraska leaves - narrow strips, colorful. Its cultivation are: *Dracaena deremensis*, *Dracaena marginata*, *Knerkii*, *Massangeana*, *Rothiana*, *Victoria*.

Dratsenata is a tropical plant and is easy to bear minimum temperature 18 degrees. Recommended values are, however, between 24 and 27 degrees. Specimens with colorful leaves need plenty of lighting so as not to lose its color. Avoid, however, to expose plants to the sun trap of a strong or even indirect exposure / at noon /. Most suitable are protsedenite through thin curtains or blinds or rays of light rooms with eastern or western exposure. Direct sun light may be a reason for the appearance of scars by burned on the surface of the leaves. On the other hand, dappled coloration of dratsenite fades and disappears in the possession of the predominantly shady place. During growth dratsenata we need a lot of water. If in summer you can ensure its optimal ambient temperature, just keep the soil moist but not waterlogged, and the rest of the year is to worry slightly damp. If the leaves begin to fall off, this is usually due to insufficient moisture and air irrigations. Massacre of dark spots on the leaf blade is sure symptom of scantily irrigation. Dpatsenata loves very high air humidity. Earthworks in subjecting her plate grit and keep them constantly wet, not cover them completely with water. If necessary the plant the morning dew. If the plant is too large, can be easily trimmed.

If leaves are dark pokraya, you can follow poorezhite as their initial form. Fueling is 4 times per year with diluted liquid detergent. I just bought or replanted dratseni do not need fertilization, because the fresh earth provides enough nutrients for 4 months at least.

If korenchetata begin to show in a hole ottseditelniya saksyatya, this is a sign that you need to move into a new dratsenata larger pot filled with clay soil. Excessive expansion of the plant, it could easily trimmed or cut to 7-10 cm from the base. From the trunk will soon ride shoots and flower will not only recover, but will become more healthy and beautiful appearance.
